

Week 2: Visual Encodings

CMSC471: Introduction to Information Visualization

Fumeng Yang, Assistant Professor

February 2, 2025

University of Maryland, College Park

<https://fumeng-yang.github.io/CMSC471>

What is a data visualization?

Dataset types

tabular, network, spatial, etc.

Variable (attribute) types

nominal, ordinal, etc.

Visual channels

length, color, opacity, etc.

Graphical marks

elements: point, line, area, etc.

Dataset types

Tabular

A collection of records
with named attributes.

this is a roster

Dataset types

Networks

Nodes and links can also have attributes

Dataset types

2022 Maryland Gubernatorial Election Results by County

<https://www.engagetu.com/2022/12/21/maryland-2022-gubernatorial-election-results-by-county/>

Spatial

Continuous "fields" vs
discrete "positions"

Variable (attribute) types

Nominal/Categorical

=, ≠

Labels or categories. E.g., Fruits: apples, bananas, cantaloupes, ...

Ordinal

=, ≠, <, >

Ordered. E.g., Quality of meat: Grade A, AA, AAA

Quantitative (Interval)

=, ≠, <, >, -

Interval (zero can be arbitrarily located). E.g., Dates: Jan 19, 2018; Location: (Lat 42.36, -71.09) Only differences can be calculated (e.g., distances or spans).

Quantitative (Ratio)

=, ≠, <, >, -, %

Fixed zero. E.g., Physical measurement: length, mass, temperature, counts and amounts. Can measure ratios or proportions.

Visual channels

Used to encode data values as characteristics of marks

From 1967, so Bertin only accounted for visualizations that were printable, white paper.

		POINTS			LIGNES			ZONES

mark: line

$d_{\text{temporal}} \rightarrow x$

$d_{\text{quantitative}} \rightarrow y$

$d_{\text{ordinal}} \rightarrow \text{color}$

What makes a "good"
data visualization?

Expressiveness

A set of facts is **expressible** in a visual language if the sentences (i.e. the visualizations) in the language express *all the facts in the set of data, and only the facts in the data.*

Data

Mapping or Visual Encoding

Visual

Expressiveness

A multivariate dataset may be inexpressive in a single horizontal dot plot because multiple records are mapped to the same position.

Expressiveness

A set of facts is **expressible** in a visual language if the sentences (i.e. the visualizations) in the language express **all the facts in the set of data, and only the facts in the data.**

Effectiveness

A visualization is more **effective** than another if the information it conveys is **more readily perceived** than the information in the other visualization.

Effectiveness

How to **meet** my goals?

If we know our goals...

How to meet our goals

Principles or empirical rules, existing idioms		We'll see a lot in the course
Understand viewer's perception		Next lecture
User study or controlled experiments		Typically more research work
Iterations, discussion with other designers		Work in groups

Principles or empirical rules

Using space (in)effectively ◀

Hiding/revealing data

(Mis)leading readers

Using space (in)effectively

Why might this visualization be inexpressive?

What information is hard to find out through this visualization?

Using space (in)effectively

Using space (in)effectively

Truncate the y-axis: lie? effective?

If the zero value doesn't make much sense.

To emphasize quantitative-interval (vs. quantitative-ratio) comparisons.

If it is the norm (e.g., stock charts).

Reasonable aspect ratio

Does one chart appear more correlated than the other?

They are the same data!

How about this chart?

$x_{\text{diff}} = 10$

$y_{\text{diff}} = \sim 20$

Reasonable aspect ratio

Use aspect ratio (**visual**) to reflect **data** ratio

$y_{\text{diff}} = \sim 17$, $x_{\text{diff}} = \sim 10$, so $y:x = \sim 1.7$

35% increase $\approx 1/3 \approx 1:3$ aspect ratio

Scaling axes: outliers & skew

Not effective?

Clip them out?

not easy to compare
but showing all data

but...

Iraq's bloody toll

Dual axis charts

Dual axis charts

We can make all kinds of statements with our two data sets if we just tweak the scales a little bit....

Orange steady,
Blue massively increasing.

Blue steady,
Orange increasing.

Both started at the same
level, but Orange increased
far more than Blue.

Both started at the same
level, but Blue increased far
more than Orange.

Both started with the
same increase, then Blue
raced to the top.

Both steady.

Dual axis charts

Don't ask
one chart to
do too much

Correlation vs. causality

The more cigarettes we consume, the more we live...?

There is a positive relationship between cigarette consumption and life expectancy.

Correlation vs. causality

by income
→

Correlation vs. causality

Simpson's Paradox

A trend or result that is present when data is put into groups that reverses or disappears when the data is combined.
